Clinical Trials Centre

Faculty of Medicine
The University of Hong Kong

Clinical Trials Centre (CTC) is a leading academic research organization established under the Faculty of Medicine of The University of Hong Kong (HKU), dedicated to offering one-stop solutions in support of clinical research. We are committed to enhancing healthcare by promoting the quality and efficiency of clinical research through ethical consideration, scientific expertise, quality assurance and education. Our main activities include research consultation, project management, regulatory affairs, budget and contract administration, site management, data management, medical statistics, central laboratory, research pharmacy and education.

FOREWORD

Globalization of clinical research

Good clinical practices have been implemented in established regions - such as North America, Europe and Japan - since the early 1980s. Introduction of the ICH GCP guidelines in 1996, however, triggered globalization of clinical research, revolutionizing the entire drug development process.

Hong Kong is a winner in this global revolution. Since 1996, there has been a striking increase in the number of drug clinical trials - from around 20 per year before 1996 to 118 in 2004. The increase in clinical research resulted in clinical trials extending beyond the two academic medical faculties to non-academic hospitals and clinics. Among the 175 study sites for 115 drug trials initiated in Hong Kong in 2002, 75 (43%) were non-academic sites.

There are many reasons behind Hong Kong's success as one of the most popular places for conducting global clinical trials in Asia - including its strategic location, state-of-the-art infrastructure, high quality healthcare, transparent legal system, simple regulatory requirements and dense population. Key opinion leaders and internationally recognized clinical investigators are also considered a major attraction. Between 1995 and 2004, Hong Kong clinical investigators published a total of 116 full papers in four major high-impact international medical journals including BMJ, Lancet, JAMA and NEJM - ranking No. 2 in Asia after Japan. On a per capita basis, Hong Kong - with a population of 6.9 million - in fact tops the list (16 papers/million).

International recognition

Hong Kong's accelerating involvement in global clinical trials has attracted the attention of major drug regulatory agencies in various countries. Since the first U.S. FDA inspection in Asia in 1997, the agency has completed nine investigative site inspections in five Asian cities - five of which were in Hong Kong. Satisfactory results from all five, as well as other regulatory inspections and sponsor audits, all underlined the internationally-recognized quality of research in Hong Kong.

Industry players of various backgrounds and objectives have become increasingly enthusiastic about collaborative opportunities in Hong Kong. Among hundreds who paid visits to CTC, there were professional life sciences investors looking for investment opportunities in drug discoveries, and mainland China healthcare companies seeking clinical development advice.

Performance and Potential

In pace with the globalization process and responding to the changing needs of trial sponsors and investigators in the new era, CTC accelerated its expansion plan in 2004 - extending the scope of activities, geographic coverage and the size of the team. We officially launched ClinCluster - Hong Kong's new multicentre clinical study site management platform. To prepare for our future activities in mainland China, we entered into collaboration with the First Affiliated Hospital of Sun Yat-sen University in Guangzhou, China in the areas of central laboratory services and clinical research in general. We have also joined forces with reputable researchers and medical institutions in the U.S., mainland China and Hong Kong to establish a China Spinal Cord Injury Network for developing promising therapies for spinal cord-injured patients through international-standard clinical trials in China. We are proud that CTC has evolved into a leading academic research organization in the region.

Hong Kong is meanwhile emerging as an important hub for global drug discovery and development. As a leading organization at the forefront of the research wave, CTC will continue to play a significant role in the challenging future.

"We are proud that CTC has evolved into a leading academic research organization in the region."

Johan Karlberg BSc (Stat & Edu), MD, PhD (Anat & Cell Biol)

Director & Professor

Year of breakthrough

Breakthroughs are not accidents but the result of continuous effort. Thanks to the effectiveness, creativity and enthusiasm of our team, 2004 was an encouraging breakthrough year for CTC.

Since the second quarter, setting up multicentre clinical trials in Hong Kong is far simpler and efficient due to the launch of ClinCluster - the unique Hong Kong network for clinical trials. At the same time, Alab - our central laboratory services platform - started serving sponsors in their multicentre clinical trials. Formation of a strategic alliance with the First Affiliated Hospital of Sun Yatsen University in Guangzhou further extended our central laboratory network, offering a smart solution for analysis of specimens collected for global clinical trials conducted in mainland China. We anticipate these developments will bring about marked changes in the way multicentre clinical trials are planned for and managed in Hong Kong, China and the Asian region.

Capitalizing on these new initiatives as well as CTC's other cutting edges, the number of newly contracted industry-sponsored clinical studies increased for the fifth straight year to 53, representing a 23% jump above 2003. Revenue from industry-sponsored clinical studies and related services also reached a record high of HK\$13 million - an impressive 25% growth over the preceding year.

Where there is a will, there is a way. 2004 was a good year for CTC, and our journey continues. After all, breakthroughs do not happen by accident.

*Henry Yau BSc (Biochem), MBA (Finance)
Assistant Director & Business Development Manager*

A new horizon in the conduct of multicentre trials in Hong Kong

In Spring 2004, ClinCluster - the unique Hong Kong clinical study sites network - was born.

ClinCluster is one of the largest site management organizations, embracing a network of hospitals/clinics and a population of 6.8 million. It offers expertise in all therapeutic areas and provides easy access to a large number of trial subjects, from patients with acute or chronic diseases to healthy volunteers. The high quality data and strict ICH GCP compliance by clinical investigators and ethics committees in the network have been confirmed by several satisfactory inspections by major regulatory agencies including the U.S. Food and Drug Administration.

ClinCluster offers trial sponsors a one-stop platform for feasibility assessments, ethics committee applications, budget calculation, contract management, and payment administration. The "standard-budget, standard-contract" concept and availability of master clinical trial contracts with major trial sponsors greatly simplify administration for multicentre studies, allowing trial sponsors and clinical investigators to focus on their core research. By the end of the year, eight phase II and III clinical studies were confirmed in 12 hospitals/clinics, and the list keeps growing.

In ClinCluster, everyone is a winner!

*Henry Li BPharm, MSc, MRPharmS
Clinical Research Manager*

ACHIEVEMENTS

Industry Collaboration

Committed collaboration

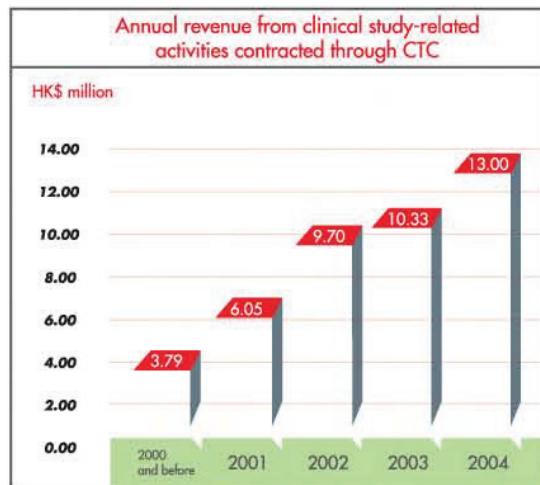

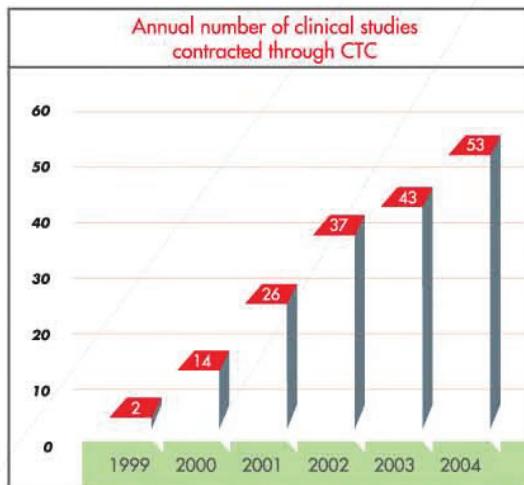

As an academic research organization dedicated to enhancing clinical research in the region, CTC has continued to strengthen its industry-academic collaboration platform in clinical research. Since establishment in 1998, CTC has strived to build long-term collaboration with trial sponsors worldwide through development of master study site agreements. In 2004, CTC initiated collaboration with another six trial sponsors, increasing the number of master study site agreements to 43. Availability of master study site agreements streamlines the contract negotiation and study preparation process, which helps encourage continuing clinical research activity in Hong Kong by trial sponsors.

Trial sponsors with a master study site agreement developed through CTC

Abbott Laboratories	Merck Sharp & Dohme
Achillion Pharmaceuticals	Merck KGaA
Advanced Herbal Therapeutics	Novartis
Arrow Therapeutics	Novo Nordisk
AstraZeneca	OSI Pharmaceuticals
Aventis Pharma	Organon
BCIRG	Pfizer

Biocompatibles	Roche
Boston Scientific	Sanofi-Synthelabo
Bristol-Myers Squibb	Schering-Plough
Celltech	Serono
CK Life Sciences	Servier
Eli Lilly	St. Jude Medical
Everpride Biopharmaceutical	Theravance
GlaxoSmithKline	Triangle Pharmaceuticals
Idenix Pharmaceuticals	Tularik
Johnson & Johnson	Vigconic
Kowa	Wyeth Pharmaceuticals
LG Life Sciences	Xanthus Life Sciences
Lundbeck	Zila
Medtronic	

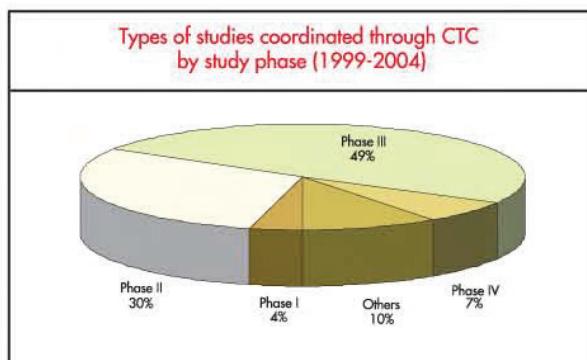

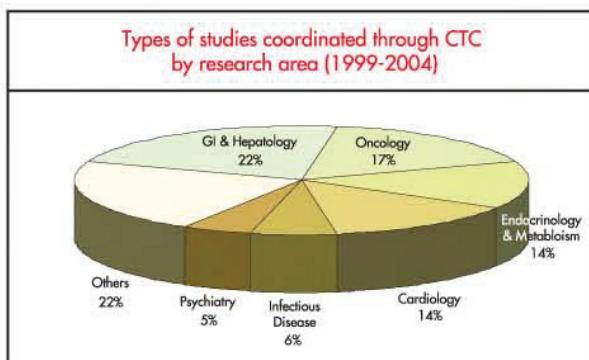

Uninterrupted growth

2004 was a "year of harvest" for CTC. Despite the impact of SARS in 2003, CTC shifted into high gear again. The number of newly contracted industry-sponsored clinical studies increased by 23% over the preceding year to 53 - equivalent to averaging one new study per week. Revenue from industry-sponsored clinical studies and related services increased sharply to HK\$13 million, a 25% jump over 2003. The cumulative contract value since CTC's establishment in 1999 passed HK\$100 million. Among the 175 studies contracted in the last six years, 90 were closed and the others are in active progress.

Diversity in research types

Gastroenterology and Hepatology remained the most active research areas, accounting for 22% of all industry-sponsored clinical studies coordinated through CTC. Other active research areas include Oncology, Cardiology, Endocrinology and Metabolism, Infectious Disease and Psychiatry. Phase II and III studies together represented 79% of all studies in terms of study phase.

ACHIEVEMENTS

Strategic Clinical Development

Product development planning

Development of new healthcare products such as drugs, biologics and medical devices is a highly complicated and lengthy process requiring large inputs of scientific expertise, human resources and financial investment. Smart formulation and implementation of product development strategies are critical success factors of every healthcare company.

During 2004, CTC strengthened its partnership relationship with startup healthcare companies through early participation in their strategic product development planning process. In the booming pharmaceutical, biotechnology and Chinese medicine industry in the region, CTC will play a more active role in strategic product development.

A model for modern Chinese medicine development

Modernization of Chinese medicine has attracted growing public attention worldwide in recent years. Since 2000, CTC has been providing consultation in clinical development of Chinese medicine products to companies in Hong Kong and mainland China, including Vigconic (International) Limited.

Vigconic, a subsidiary of a Hong Kong listed company, is a research-based Chinese medicine company focusing on development

of Chinese medicine products in the areas of liver diseases therapy, immunomodulation, and alleviation of cancer-related and aging-related conditions. Since 2003, CTC has been assisting Vigconic in strategic planning for clinical development of its products. In early 2004, Vigconic initiated a phase I/II clinical trial of Vigchemo, a product for alleviating chemotherapy-related adverse effects in cancer patients. Another clinical trial of Vitalliver, a product for liver diseases therapy, began towards the end of the year.

In 2005, CTC will help initiate a multicentre clinical trial of ViNeuro against Parkinson's disease, as well as a large scale phase II efficacy study of Vigchemo.

The committed research collaboration between Vigconic and CTC demonstrated the efficiency and effectiveness of strategic industry-academic collaboration, which is anticipated to become a model for modern Chinese medicine research and development.

Participation of CTC in Vigconic's development pipeline

Product	Indication	Status of Development
Vigchemo	Alleviation of chemotherapy-related adverse effects	Pilot phase I/II clinical trial successfully completed. Large scale phase II efficacy clinical trial will start in 2005.
Vitalliver	Treatment of Cirrhosis	Large scale phase II clinical trial ongoing.
ViNeuro	Treatment of Parkinson's disease	Large scale multicentre phase II clinical trial will start in 2005.

Tailored solutions

Management of clinical studies requires multiple expertise and skills, and harmonization of them. Success of every clinical study relies on effective project management - from scientific conceptualization to project planning and management.

During the year, CTC expanded its project management team substantially, providing tailored solutions to meet the specific needs of trial sponsors in the rapidly changing clinical research environment in the region. CTC's project management team will continue to support trial sponsors' research activities, turning their seeds into flowers.

The clinical study project management process

Speedy startup of clinical trial

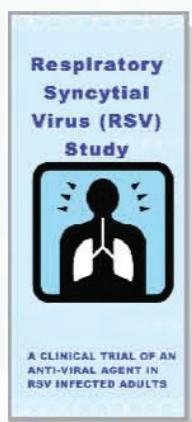

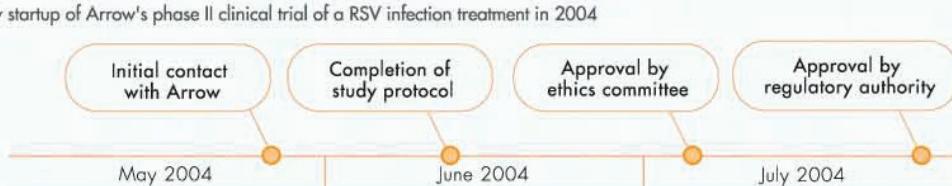

Clinical trials account for more than half of the time required to bring a new drug from the laboratory to the market. Quick startup of clinical trials helps shorten the clinical development period - and speed up the availability of new medications to the public.

In mid-2004, CTC facilitated speedy startup of a phase II clinical trial of a respiratory syncytial virus (RSV) infection treatment, a novel drug developed by Arrow Therapeutics Limited. To catch the epidemic season of RSV

in Hong Kong, CTC formed a special project team of clinical investigators, virologists, clinical pharmacologists, research pharmacists, project managers, regulatory affairs professionals, data managers, medical statisticians, laboratory professionals and financial professionals. With this joint effort, CTC successfully helped Arrow develop a study protocol, secure necessary ethics committee and regulatory approvals, and prepare the clinical trial for initiation within an extremely short period of eight weeks.

Before commencement of the clinical trial, a RSV epidemiology study was conducted, during which a modified PCR-based RSV diagnostic test was developed.

Arrow Therapeutics Limited is a UK-based pharmaceutical company dedicated to novel anti-infective drug discovery and development. Its research pipeline contains a range of anti-virals and anti-bacterials.

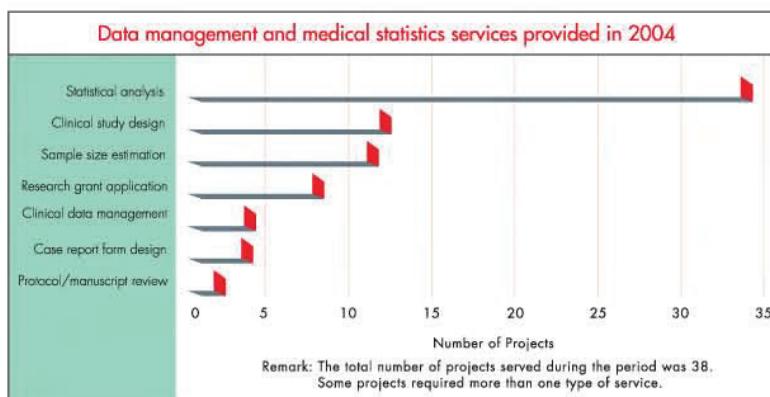

ACHIEVEMENTS

Data Management and Medical Statistics

Strategic approach

Clinical data are the most valuable asset on which the success of every research-based healthcare company is based. CTC sees data management and medical statistics as a strategic element with a decisive influence on product development strategies, and believes integration with other strategic functions can create considerable advantages that drive success in a shorter time and lower cost.

In 2004, CTC implemented tighter integration of its data management and medical statistics team with its project management team. CTC's medical statisticians and data managers, with the support of project managers and other professionals, provided strategic data management and medical statistics services - from protocol development to statistical analysis and reporting - for 38 academic and sponsored clinical studies in various therapeutic areas and phases. Specific services provided included clinical study design, sample size estimation, protocol/manuscript review, case report form design, clinical data management, statistical analysis and research grant application.

Critical data review and analysis

The healthcare industry in China has been growing rapidly in recent years. Research-based China healthcare companies are investing more and more resources into research and development, in anticipation of appealing to the international market.

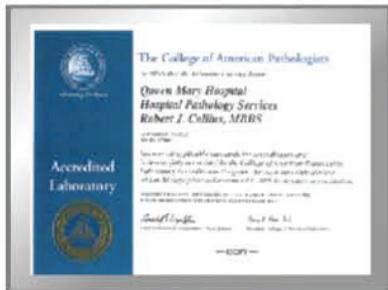

During 2004, CTC was approached by a healthcare company founded in mainland China to assist in clinical development of a Chinese medicinal viral infection treatment. In line with its product development strategy, the company invited CTC to perform critical review and analysis of the product's clinical trial data

that were collected from study sites in mainland China. It is anticipated the analysis results will form the basis for further clinical development, with the ultimate objective of securing international acceptance of the product, and benefiting overseas as well as local patients.

Accreditation by the College of American Pathologists

From Asia and beyond Asia

After years of preparation and development, Alab, CTC's central laboratory service platform, came into operation in the second quarter of 2004. Situated in the prime Asian logistical hub, Alab is the ideal choice for supporting regional clinical studies in Asia. Together with the central laboratory network of CentralLabS Clinical Research, CTC's global central laboratory partner, CTC is capable of providing global central laboratory services to trial sponsors worldwide.

A step forward into the mainland

In November 2004, CTC formed a strategic alliance in clinical trial central laboratory business with the First Affiliated Hospital of Sun Yat-sen University in Guangzhou, China. The alliance extended CTC's central laboratory capability into mainland China, adding an important competitive advantage to the existing global central laboratory network developed jointly by CTC and CentralLabS. The strategic move offers smart central laboratory solutions on the mainland, an initiative long awaited by trial sponsors.

The First Affiliated Hospital is the largest general hospital among the eight affiliated hospitals of Sun Yat-sen University. The hospital ranks among the most important centres for medical treatment, teaching, research and rehabilitation in southern China, and is well known for its sophisticated techniques and high standard of medical services. As early as 1993, it passed national evaluation and gained a 3A rating, the highest level under mainland China's hospital classification system. Its core laboratory is equipped with advanced diagnostic facilities and staffed by highly qualified clinical laboratory professionals.

The Core Laboratory of the First Affiliated Hospital of Sun Yat-sen University, Guangzhou

Hong Kong

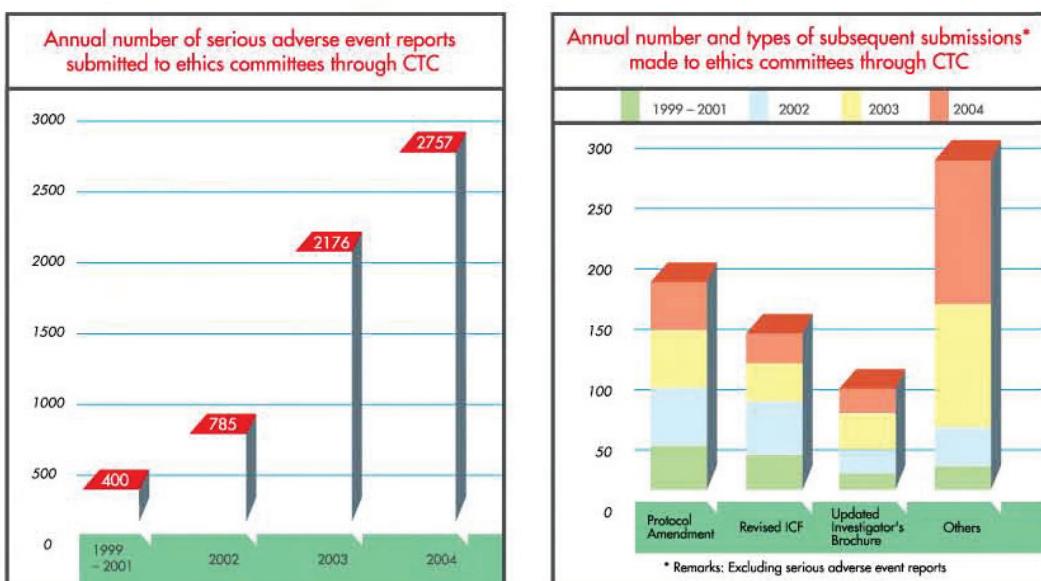

ACHIEVEMENTS

Site Management

Ethical review

Ethics is a core of clinical research. In line with the upsurge in clinical research activities, a substantial increase in the number of submissions to ethics committees was seen in 2004. During the year, 56 initial applications and 243 subsequent submissions, as well as 2,757 serious adverse event reports, were made to ethics committees. As the centre responsible for overseeing the level of protection of human subjects in clinical studies at HKU, CTC conducted the first internal audit of the affiliated ethics committee.

Regulatory inspection

Following inspections in 1998 and 2002, HKU was inspected in December 2004 for the third time by the U.S. Food and Drug Administration for its participation in a global clinical trial of an investigational new drug. The satisfactory results of such inspections not only demonstrated HKU's outstanding clinical research capabilities and quality, but also its increasingly important contribution to multinational clinical research.

Investigator-initiated studies

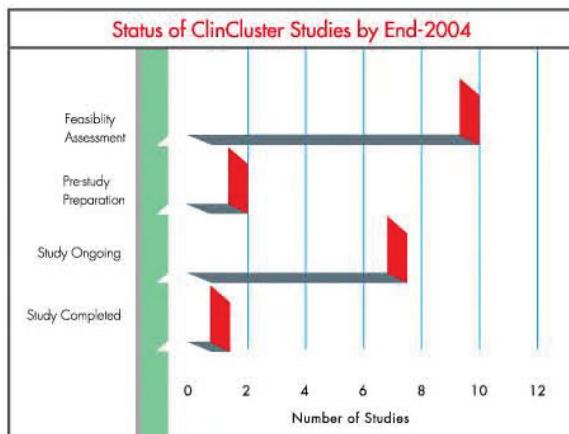

With the implementation of the European Union Directive on Clinical Research on May 1, 2004, there is a call for regulation of investigator-initiated studies at the same standard as industry-sponsored studies worldwide. At the request of clinical investigators, CTC has started offering ethics submission and regulatory affairs supports for investigator-initiated studies at HKU since December 2004. Such new support is not only welcomed by clinical investigators but also expected to help raise the quality of academic research at HKU.

ClinCluster

In the second quarter of the year, the first and the only Hong Kong clinical study sites network - ClinCluster - was formed.

ClinCluster is a unique platform integrating the medical and scientific expertise, research facilities and patient populations of medical institutions in the network. Through ClinCluster, trial sponsors can easily initiate multicentre clinical studies in Hong Kong and take advantage of ClinCluster's novel concepts - free feasibility assessment, standardized budget and contract, and continuous study site support. By the end of 2004, 14 trial sponsors experienced the benefits of ClinCluster services, with eight studies successfully initiated in 12 hospitals/clinics. It is anticipated that ClinCluster will unleash Hong Kong's clinical research potential, making it one of the world's most admired clinical research hubs.

ACHIEVEMENTS

Education

Postgraduate programmes

CTC's postgraduate programmes continued enjoying great popularity in 2004. In addition to Postgraduate Diploma and Postgraduate Certificate programmes in Clinical Trials Research Methodology and in Medical Statistics, a Master of Public Health programme (MPH) - replacing the previous Master of Medical Sciences programme - was launched in collaboration with Department of Community Medicine of HKU.

During the year, 20 candidates were admitted to CTC's postgraduate programmes. Since 1998, 77 candidates have enrolled and 43 have already graduated. With increasing clinical research activities in the region, it is confidently expected the programmes will continue to attract research professionals and students interested in contemporary clinical research.

Symposium on clinical trial central laboratory services

CTC, together with its central laboratory partner CentralabS Clinical Research, organized a "Symposium on Clinical Trial Central Laboratory Services" on March 27, 2004. The symposium provided expert opinion on issues relating to clinical trial central laboratory services, international clinical laboratory accreditation and clinical specimen transportation logistics - plus a special lecture on SARS virus characteristics and vaccine development. Over 100 participants from academic institutions, hospitals and the pharmaceutical industry attended the event.

International research efforts

In addition to sponsored clinical studies, CTC also actively participates in international scientific research activities. In September 2004, the HKU Spinal Cord Injury Fund (HKU-SCI) was founded to fund spinal cord injury research and educational activities coordinated by the China Spinal Cord Injury Network (China SCI Network), an international research collaboration initiated by highly reputable researchers and institutions from the U.S., mainland China and Hong Kong. CTC will serve as the coordinating centre for running clinical trials in major spinal cord injury treatment centres in mainland China and Hong Kong, with the ultimate goal of developing promising therapies for spinal cord-injured patients.
